JOSH KAPPLER

Software engineer. Production LLM agents and the full-stack products around them.
San Francisco, CA · 512-210-9934 · Joshua.Kappler@gmail.com · github.com/joshkappler · joshuakappler.com

EXPERIENCE

Founding Developer Experience Engineer
Jul to Sep 2026

General Translation, seed-stage localization infrastructure, San Francisco. Position eliminated in September.

- Built Ask AI, the dashboard's embedded assistant: it answers from about 400 pages of live product docs through its own retrieval tools, with read-only account tools and per-plan model tiers, rate limits and usage billing.
- Shipped the outbound growth engine: agents find and score leads, a scout crawls each prospect's live site and catches real localization errors, and the outreach email is written around that evidence; a person confirms every send.
- Built autodemo, a pipeline that turns a docs page into a finished demo video in any language: it writes the scene script, scaffolds a working app, drives a real browser and code editor, records the run and cuts the video.
- Ran a security audit of the platform with seven fix PRs across auth, CI and the CLI. 152 merged PRs across the platform and its open-source SDKs in six weeks.

Software Engineer, Contract
2024 to 2026

Independent, San Francisco. AI agent systems shipped end to end for clients.

- Built a deal-analysis platform for a private credit firm, in production with its analysts: it ingests PDFs, spreadsheets and emails and writes investment memos with every claim cited to its source page. Durable multi-step pipeline (Vercel Workflow), pgvector retrieval, forced tool_use extraction of about 40 fields, PDF and Excel export. Demo: memo.joshuakappler.com/demo.
- Built an unattended lead pipeline for a real-estate cash buyer: four agents on an hourly cron find, research, score and draft outreach for off-market properties, at about $0.22 per 33-property batch.

Founder, Boffy LLC
2019 to present

Gaming YouTube channel with 2.1M subscribers and 270M views (youtube.com/boffy).

- Grew the channel from zero; wrote and presented 136 long-form videos; hired and directed a team of three.
- Brand partnerships with RedMagic, Wargaming and GeoGuessr; a branded store; a commercial Minecraft server.

PROJECTS

- **claim wright**: insurance claim adjudication. Claude extracts the facts through forced tool_use and a deterministic Python engine computes the payout. 91% of decisions within $250 of the human adjudicator, median error $0, about $0.33 per claim.
- **autohack**: an autonomous bug-bounty hunter: a 12-state finding lifecycle across seven platforms, an adversarial second-model review of its own findings, and reports drafted behind a human approval gate.
- **pinch**: Claude Code driven from an Apple Watch over cellular: a native watchOS client and a Claude Agent SDK backend, with at-least-once prompt delivery and session resume so a prompt never gets lost or runs twice.
- **sniply**: a live booking marketplace for barbers with no AI in the runtime path: Postgres advisory locks against double booking, 291 tests including 54 Playwright end-to-end.
- **herdr layout**: a Rust terminal-UI fork that runs nine parallel Claude Code sessions: boxed-tab sidebar, live action lines, native detail panel. My daily cockpit.
- **survival station**: an air-gapped, solar-powered AI computer: local models behind a stdlib-only Python server and an 85 GB offline library including all of English Wikipedia.

SKILLS

- **Languages:** TypeScript, Python, JavaScript, SQL, Swift (watchOS)
- **AI / LLM:** Anthropic SDK and Claude Agent SDK, OpenAI SDK, Gemini, tool_use and structured extraction, prompt caching, agentic RAG with pgvector, multi-provider routing, LoRA fine-tunes and local inference with Ollama
- **Web and infrastructure:** Next.js 16, React 19, Node.js, FastAPI, tRPC, Electron, Tailwind CSS, PostgreSQL, SQLite, Drizzle ORM, Zod, Pydantic, Vercel Workflow, Playwright, Vitest, pytest, Git, Claude Code

EDUCATION

University of Oregon, Computer Science coursework (AI and ML track)
2023 to 2024
